

ASSIGNMENT 1

Understanding the Data Science Workflow with Sample Problem:

- Take standard structured dataset related to problem domain of your choice such as heart disease analysis, student performance, etc.
- Clean the dataset.
- Perform EDA on cleaned data. (Hint plot the data)
- Write at least two observations from EDA.
- Apply a machine learning or data science technique to encode your observation in EDA.
- Is there any relation between the attributes in dataset and labels?
- Represent the relation using graph.
- What is the specific mathematical relationship between the the attributes in dataset and labels?
- Is there any abnormality? What conclusion do you draw about abnormal data?
