

ASSIGNMENT 2

Objectives:

- Getting the data
- Cleaning the data
- Organizing the data - organize the cleaned data into a way that is easy to input into other algorithms

Problem:

Look at transcripts (similar to transcripts of some comedians from [Scraps From The Loft](#)), pre-process and organize the data to note their similarities and differences to find various patterns.

1. Perform the following data cleaning on transcripts:
 - i) Make text all lower case
 - ii) Remove punctuation
 - iii) Remove numerical values
 - iv) Remove common non-sensical text (\n)
 - v) Tokenize text
 - vi) Remove stop words
2. Organized data in two standard text formats:
 - a) Corpus - corpus is a collection of texts, and they are all put together neatly in a pandas dataframe here.
 - b) Document-Term Matrix - word counts in matrix format
3. Can you add an additional regular expression to the `clean_text_round2` function to further clean the text?
4. Play around with CountVectorizer's parameters. What is `ngram_range`? What is `min_df` and `max_df`?
